Software Model: Spiral

Reasoning for choosing the Spiral model was because we felt that the focus should be on the share holders' interests. Since we were not sure if our customer was going to change their focus, we wanted to have a model in place so that we periodically checked in to see how the customer felt about our progress. This allowed us to make changes as we felt were needed.

Total Estimated Man Hours at the start: 170 hours with a confidence level of 81%.

How we accomplished our current product:

- We routinely met at least once a week for an hour.
- Most of these meetings were done online through Google Hangouts.
- Whenever changes needed to be made, we made sure that everyone was in agreement.
- We used Google Docs as a way to share our thoughts.
- All code was stored via subversion.
- We broke up the work based off of logical pieces.
- At the start, we aimed at having a deliverable roughly once a week.
